HNC5W
HawkVision Smart Cam Pro

Manual

PREFACE

Thank you for purchasing the HNC5W HawkVision Smart Cam Pro, a standalone system that can be connected directly to an Ethernet or Wireless Network.

Equipped with a megapixel CMOS sensor, the camera allows you to capture a wider field of view with a resolution of up to 1280 x 1024. With support for latest H.264 technology, you can record streaming video that utilizes high quality H.264 images to your hard drive, enable motion detection and setup automated e-mail alerts for security.

With the Infrared LEDs and light sensor on the camera, you can capture clear images even in a dark environment. The camera's pan/tilt functions allow you to control the camera to monitor everywhere remotely. In addition, the camera can attach a variety of external devices for your specific purposes through the GPIO connectors.

Compared to the conventional PC Camera, this camera features a built-in CPU and web-based solutions that can provide a cost-effective solution to transmit the real-time high-quality video images and sounds synchronously for monitoring. The camera can be managed remotely, so that you can use a web browser to access and control it from any desktop/notebook computer over the Intranet or Internet.

The simple installation procedures and web-based interface allow you to integrate it into your network easily. With comprehensive applications supported, the Internet camera is your best solution for remote monitor, high quality, and high performance video images.

This manual provides you with the instructions and illustrations on how to use your camera, which includes:

Chapter 1 **Introduction to Your Camera** describes the features of the camera. You will also know the components and functions of the camera.

Chapter 2 **Hardware Installation** helps you install the camera according to your application environment. You can use this camera at home, at work, at any where you want.

Chapter 3 **Accessing the Camera** lets you start using your camera without problem. The camera can be set up easily and work within your network environment instantly.

Chapter 4 **Configuring the Camera** guides you through the configuration of the camera using the Web browser on your PC.

Chapter 5 **Appendix** provides the specification of the camera and some useful information for using your camera.

NOTE The illustrations and configuration values in this guide are for reference only. The actual settings depend on your practical application of the camera.

Contents

CHAPTER 1
INTRODUCTION TO YOUR CAMERA

1.1 Checking the Package Contents

Check the items contained in the package carefully. You should have the following:

- ☑ One HNC5W HawkVision Smart Cam Pro
- ☑ One AC Power Adapter 12V/1.5A
- ☑ One Wall Mount Kit
- ☑ One External Antenna
- ☑ One Ethernet Cable (RJ-45 type)
- ☑ One Installation CD-ROM
- ☑ One *Quick Installation Guide*

NOTE Once any item contained is damaged or missing, please contact your place of purchase or Hawking Technology.

1.2 Getting to Know Your Camera

■ **Front / Right Panel**
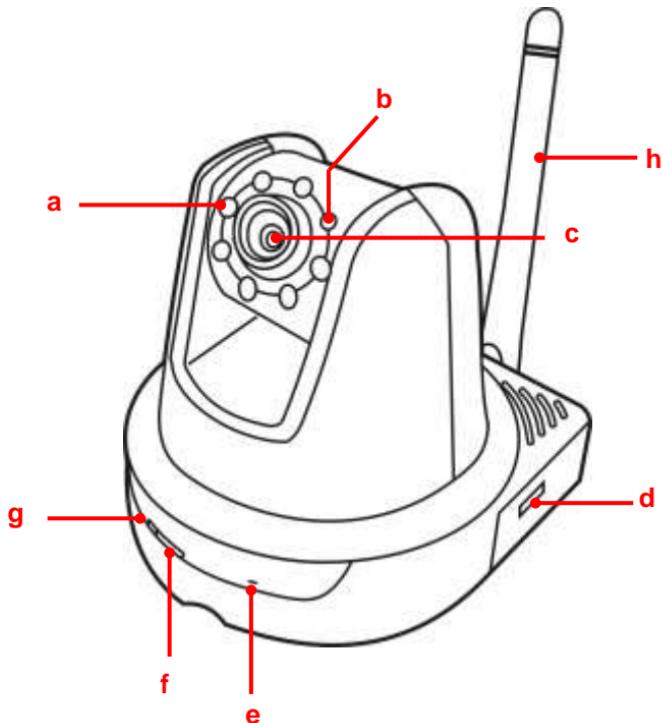

a. **Infrared LEDs** (x7) allow your camera to capture clear image in a dark environment.

b. **Light Sensor** is used to trigger on and off the Infrared LEDs according the environmental light level.

c. **Lens Assembly**

d. **USB Port** allows you to connect an external USB device. It provides the power distribution up to 500mA.

e. **Internal Microphone** allows the camera to receive sound and voice.

f. **Link LED** indicates the camera's network connectivity with the flashing green light.

g. **Power LED** indicates the camera is powered on with the steady amber light.

h. **External Antenna**

■ Rear Panel
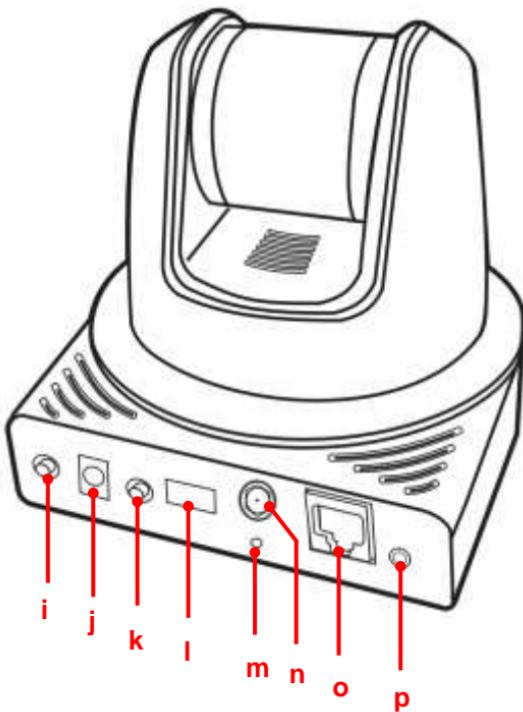

i. **USB Unmount Button** is used to remove the connected USB device safely.

NOTE After long pressing the Unmount button for four seconds, the Power LED starts flashing. When the Power LED resumes the steady amber light, you can remove the USB device safely.

j. **DC Power Connector** connects the AC power adapter, in order to supply power to the camera.

k. **WPS Button** (for wireless model) is used to protect your WLAN. Instead of entering the network name (SSID), your wireless network can be protected simply by pushing a button.

TIP For more information of using the WPS button, refer to the instruction of the Web Configuration, Network >> Wireless >> WPS Setting.

l. **GPIO Connectors** is used to connect the external devices.

m. **Reset Button** will restart the camera when it is pressed quickly; when it is pressed and held for five seconds, the camera will resume the factory default settings.

n. **Wireless Antenna Connector** (for wireless model) is used to attach the external antenna.

o. **Ethernet Cable Connector** connects the network cable, which supports the NWay protocol so that the camera can detect the network speed automatically.

p. **Audio-out Connector** connects an external active speaker.

1.3 Features and Benefits

- **H.264/MPEG4/MJPEG Multi-codec Supported**

  The camera provides you with excellent images using H.264/MPEG4/ MJPEG multi-codec selectable technology, allowing you to adjust image size and quality, and bit rate according to the networking environment.

- **High Resolution Surveillance**

  Equipped with a megapixel CMOS sensor, the high performance camera is designed for your professional surveillance and security applications. The image resolution is up to 1280 x 1024.

- **Day & Night Surveillance Supported**

  The seven Infrared LEDs around the standard lens assembly enable the camera to capture crystal clear images in the dark environment or at night. When the Light Sensor detects the environmental light level becomes low, the camera captures the images in black & white mode using these infrared LEDs.

- **Optimal Viewing**

  With the pan/tile functions, you can easily monitor everywhere via the camera by moving the camera lens to the left/right (165/165 degrees) or up/down (90/15 degrees). In addition, you can assign up to eight positions for the camera, enabling you to move the camera lens to the desired position quickly.

- **Remote Control Supported**

  By using a standard Web browser or the bundled UltraView Pro software application, the administrator can easily change the configuration of the camera via Intranet or Internet. In addition, the camera can be upgraded remotely when a new firmware is available. The users are also allowed to monitor the image and take snapshots via the network.

- **Multiple Profiles Supported**

  The camera supports multiple profiles simultaneously, so that you can separately set up different image settings (such as image quality and frame rate) for the three video types of the camera: H.264, MPEG4, MJPEG, and 3GPP.

- **Flexible Audio Capability**

  The camera allows you to connect the external microphone to receive on-the-spot audio via the Internet, allowing you to monitor the on-site voice. In addition, you can connect an external active speaker to the camera to speak through the camera (supporting mono audio only).

- **Supports RTSP**

  The camera supports RTSP (Real Time Streaming Protocol), which is a technology that allows you to view streaming media via the network. You can view the real-time video with the Quick Time player or RealPlayer. To view the real-time streaming image on your computer, open the Web browser and enter the RTSP link:

  MPEG4 stream: rtsp://(IP address of the camera)/mpeg4

  H.264 stream: rtsp://(IP address of the camera)/h264

- **Mobile Device Viewing Supported**

  The camera supports real time video viewing on your mobile device. After installing the required software applications, you can easily motor the camera's real-time video from your iPhone, iPod Touch, or iPad (requires iPhone OS 3.1 or later). The latest Android phones can be supported too.

  For iPhone application software, please search "iPuxCam" in the app store on iPhone to download and install.

  For Android application software, please visit the website: http://www.ipux.net to download and install.

- **I/O Connectors Provided**

  The camera provides the I/O connectors on the rear panel (IN/OUT), which provide the physical interface to send and receive digital signals to a variety of external alarm devices. You can connect a special featured device, and then configure the settings and control the device from the **GPIO Trigger** window of Web Configuration.

- **Multiple Platforms Supported**

  The camera supports multiple network protocols, including TCP/IP, SMTP e-mail, HTTP, and other Internet related protocols. Therefore, you can use the camera in a mixed operating system environment, such as Windows 2000/XP/Vista, and Windows 7.

- **Multiple Applications Supported**

  Through the remote access technology, you can use the cameras to monitor various objects and places for your own purposes. For example, babies at home, patients in the hospital, offices and banks, and more. The camera can capture both still images and video clips, so that you can keep the archives and restore them at any time.

1.4 System Requirement

- **Networking**
    - **LAN:**   10Base-T Ethernet or 100Base-TX Fast
                        Ethernet; Auto-MDIX.
    - **WLAN:**   (for wireless model) IEEE 802.11b/g/n

- **Accessing the Camera using Web Browser**
    - **Platform:**   Microsoft® Windows® XP/Vista/WIN 7
    - **CPU:**   Intel Pentium III 800MHz or above
    - **RAM:**   512MB
    - **Resolution:**   800 x 600 or above
    - **User Interface:** Microsoft® Internet Explorer 6.0 or above;
                        Apple Safari 2 or above; Mozilla Firefox
                        2.00 or above

- **Accessing the Camera using UltraView Pro**
    - **Platform:**   Microsoft® Windows® XP/Vista/WIN 7
    - **Resolution:**   1024 x 768 or above

- **Hardware Requirement:**
    - **1 camera:**   Intel Pentium 4 2.4GHz; 512MB RAM
    - **2~4 cameras:** Intel Pentium 4 2.8GHz; 1GB RAM
    - **5~16 cameras:** Intel Pentium 4 3.4Hz; 2GB RAM
    - **17~24 cameras:** Intel Core 2 Duo E6400; 1GB RAM
    - **25~32 cameras:** Intel Core 2 Duo E8400; 2GB RAM

NOTE If you connect multiple cameras to monitor various places
simultaneously, you are recommended to use a computer with
higher performance.

CHAPTER 2

HARDWARE INSTALLATION

2.1 Installing the Wall Mount Kit

The camera comes with a Wall Mount Kit, which allows you to place your camera anywhere by mounting the camera through the three screw holes located in the base of the Wall Mount Kit.

Screw   **Wall Mount Kit**

Screw

Screw
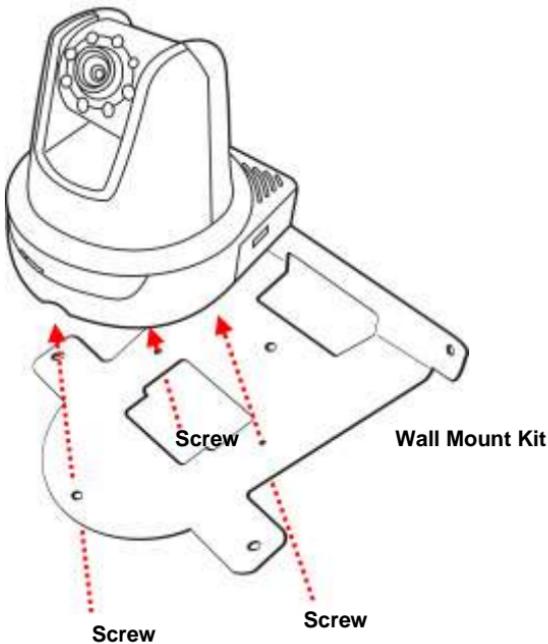

2.2 Connecting the Camera to LAN/WLAN

■ Connecting to LAN

Use the provided Ethernet cable to connect the camera to your local area network (LAN).

When you connect the AC power adapter, the camera is powered on automatically. You can verify the power status from the Power LED on the front panel of the camera.

Once connected, the Link LED starts flashing green light and the camera is on standby and ready for use now.
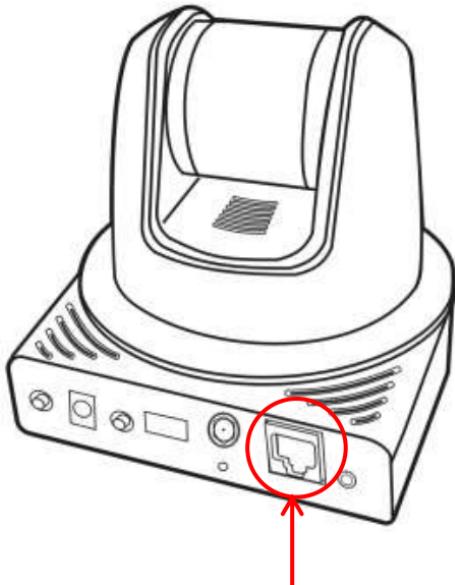

Connecting the Ethernet cable

■ **Connecting to WLAN**

If you use a wireless network in your application environment, you need to attach the included external antenna to the camera.

When the camera is powered on, the camera will automatically search any access point with "default" SSID.
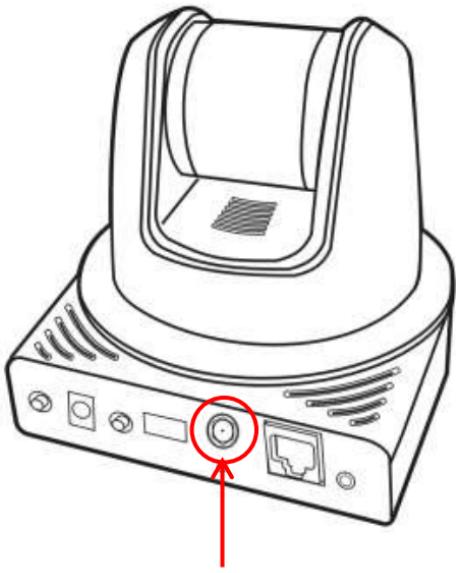

Attaching the external antenna

2.3 Applications of the Camera

The camera can be applied in multiple applications, including:

- Monitor local and remote places and objects via Internet or Intranet.

- Capture still images and video clips remotely.

- Upload images or send email messages with the still images attached.

The following diagram explains one of the typical applications for your camera and provides a basic example for installing the camera.
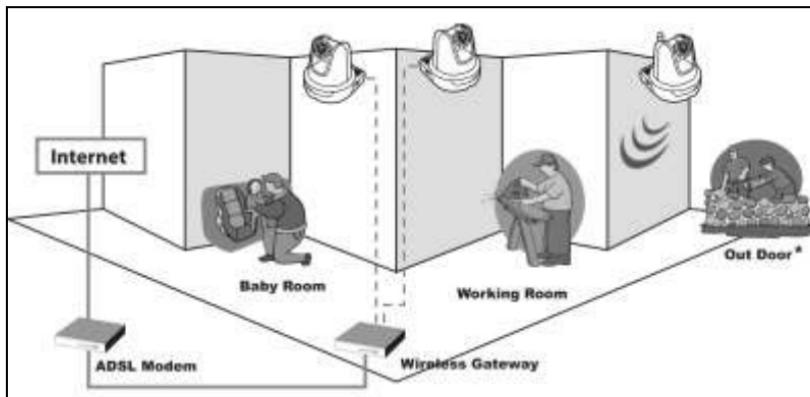

Home Applications of the Internet Cameras

* Please have the camera enclosed by waterproof housing when using outdoors.

CHAPTER 3

ACCESSING THE CAMERA

3.1 Using IPFinder

The camera comes with a setup utility, IPFinder, which is included in the Installation CD-ROM, allowing you to search for the camera on your network easily.

1. Insert the Installation CD-ROM into your computer's CD-ROM drive to initiate the Auto-Run program.

2. Click the **IPFinder** item to launch the utility. The control panel will appear as below.

Display the connected camera(s). Double click to link the Camera.

Click **About** to get the Version information of IPFinder.
Click **Link** to connect the selected camera.
Click **Change IP** to modify the IP address of the selected camera.
Click **Search** to find the IP address of the connected camera(s).
Click **Exit** to close the utility.
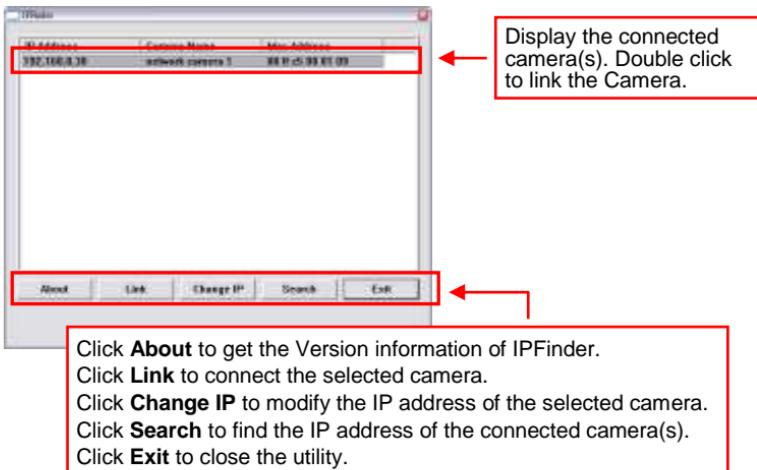

3. Once you get the IP address of the camera, launch the Web browser or UltraView Pro to access your camera.

3.2 Accessing to the Camera

Whenever you want to access the camera:

1. Since the default configuration of the camera is DHCP mode enabled, it is recommended to launch IPFinder to search he IP address that is assigned to the camera by the DHCP server, and then click **Link** to access the camera via the Web browser.

2. If Network Camera can't get IP Address under DHCP mode, the default IP Address will be 192.168.0.30.

3. When the login window appears, enter the default User name (admin) and password (admin) and press **OK** to access to the main screen of the camera's Web Configuration.

Enter the User name and Password.
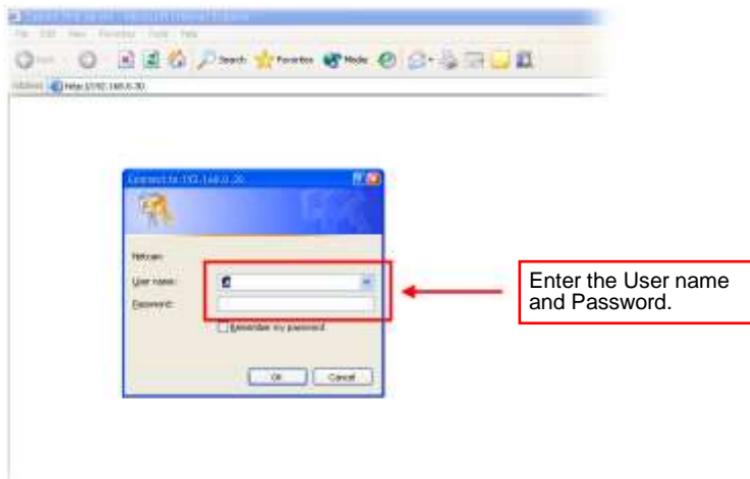

NOTE If you are initially access to the camera, you will be ask to install a new plug-in for the camera. Permission request depends on the Internet security settings of your computer. Click Yes to proceed.

After you login into the Web Configuration of the camera, the Main screen will appear as below:

The Main screen of the Web Configuration provides you with many useful information and functions, including:

❶ **Live View/Setup Switch:**

- Click the **✗ Setup** button to configure the camera. For details, see Chapter 4.

- Click the **📹 Live View** button to return to the Main screen to view the live view image.

❷ **Compression Buttons:** Select to transmit and record the video using **H.264**, **MPEG4** or **MJPEG** compression.

❸ **Pan/Tilt Buttons:** Provides the buttons to control the camera lens.

● **Left/Right/Up/Down/Home** buttons allow you to move the camera lens position. Clicking the **Home** button will move the camera lens to the assigned home position.

● **Auto Patrol** button controls the camera to automatically scan the preset positions once. Click **Stop** to stop patrolling.

● Click the **Number button** (1~8) to move the camera lens to the preset position immediately.

To set up the preset positions, move the camera lens by clicking the Left/Right/Up/Down buttons to the desired position first, then select the number (1~8) from the pull-down list and click the **Apply** button. You can enter a descriptive name for the assigned position in the text box to identify it easily.

❹ **Function Buttons:** Use these buttons to control the audio, video, and trigger functions.

● Click the **Zoom buttons** ($\boxed{1x}$ $\boxed{2x}$ $\boxed{3x}$) to zoom in the live view image by **1x**, **2x**, or **3x**.

● **Manual Record** allows you to record and save a video clip.

● **Snapshot** allows you to capture and save a still image.

● **Browse** allows you to assign the destination folder to store the video clips and still images.

● **Talk** allows you to speak out through the camera. Please note only one user is allowed to use this function at a time.

- **Listen** allows you to receive the on-site sound and voice from the camera.
- **Trigger Out** allows you to trigger on/off the GPIO output manually.

❺ **Live View Area:** Displays the real-time video image of the connected camera.

NOTE If your PC use Microsoft Vista platform, you may not find the recorded files that are saved by **Snapshot** or **Manual Record**. You need to disable the protected mode of Security in the IE Browser through the following steps:

   1. Open the Internet Explorer browser.
   2. Click **Tools > Internet Options**.
   3. Click **Security**.
   4. Disable the **Enable Protected Mode** option and then click **OK**.

3.3 Configuring the IP Address of the PC

If you fail to access to the camera using the above methods, please check the IP address of your computer. You can connect to the camera directly from your computer to configure the camera. You need to set up the IP addresses to be in the same segment for the two devices to communicate.

1. On your computer, click **Start > Control Panel** to open the Control Panel window.

2. Double-click **Network Connection** to open the Network Connection window.

3. Right-click **Local Area Connection** and then click **Properties** from the shortcut menu.

4. When the Local Area Connection Properties window appears, select the **General** tab.

5. Select **Internet Protocol [TCP/IP]** and then click **Properties** to bring up the Internet Protocol [TCP/IP] Properties window.

6. To configure a fixed IP address that is within the segment of the camera, select the **Use the following IP address** option. Then, enter an IP address into the empty field. The suggested IP address is 192.168.0.x (x is 1~254 except 30), and the suggested Subnet mask is 255.255.255.0.

7. When you are finished, click **OK**.

CHAPTER 4

CONFIGURING THE CAMERA

4.1 Using the Web Configuration

You can access and manage the camera through the Web browser and the provided software application UltraView Pro. This chapter describes the Web Configuration, and guides you through the configuration of the camera by using the Web browser.

To configure the camera, click **✗ Setup** on the Main screen of the Web Configuration. The Web Configuration will start from the **Basic** page.

The Web Configuration contains the settings that are required for the camera in the left menu bar, including **Smart Wizard**, **My Android**, **Basic**, **Network**, **Pan/Tilt**, **Video/Audio**, **Event Server**, **Motion detect**, **Event Config**, **Tools**, **USB**, and **Information**.
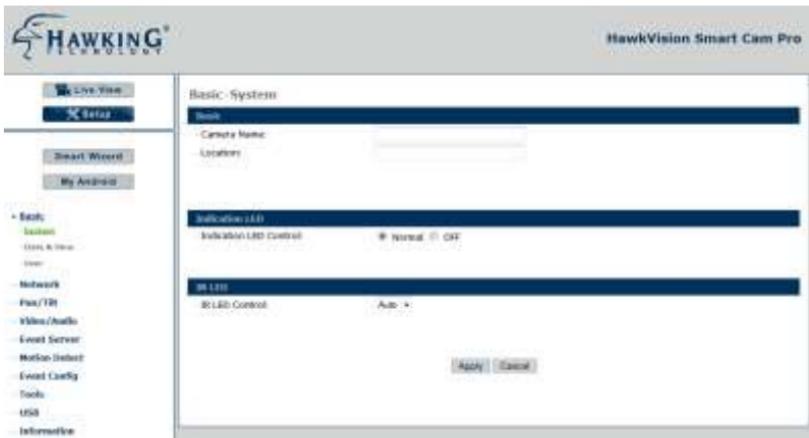

4.2 Quick Setup

4.2.1 Using Smart Wizard

The camera's Smart Wizard lets you configure your camera easily and quickly. The wizard will guide you through the necessary settings with detailed instructions on each step.

To start the wizard, click **Smart Wizard** in the left menu bar.

Step 1. Camera Settings

Camera Setting

Camera Name:	
Location:	
Admin Password:	
Confirm Password:	

Enter the name and location for the camera.

Enter the administrator password twice.

Next >   Cancel

Step 2. IP Settings

IP Setting

- DHCP
- Static IP
  - IP: `10` . `1` . `1` . `47`
  - Subnet Mask: `255` . `255` . `255` . `0`
  - Default Gateway: `10` . `1` . `1` . `1`
  - Primary DNS:
  - Secondary DNS:
- PPPoE
  - User Name:
  - Password:

Select the IP setting according to your network: **DHCP**, **Static IP**, or **PPPoE**.

< Prev   Next >   Cancel

Step 3. Email Settings

- 24 -

Email Setting

SMTP Server Address:	
Sender Email Address:	
SMTP Port:	25
☐ This server requires an encrypted connection (SSL)	
☐ STARTTLS	
Authentication Mode:	● None ○ SMTP
Sender User Name:	
Sender Password:	
Receiver #1 Email Address:	
Receiver #2 Email Address:	

Enter the required information to be able to send email with image.

< Prev   Next >   Cancel

Step 4. Wireless Networking

Wireless Networking

Network ID(SSID):	Wireless Network Site Survey
Wireless Mode:	● Infrastructure ○ Ad-Hoc
Channel:	6 ▾
Authentication:	WPA2-PSK ▾
Encryption	○ TKIP ● AES
Pre-Shared Key	password

Enter the required settings for wireless networking.

< Prev   Next >   Cancel

Step 5. Confirm Settings

- 25 -

Confirm Settings

- Camera Name:	
- Location:	
- IP Mode:	Static
- IPv4 Address:	10.1.1.47
- Subnet Mask:	255.255.255.0
- Default Gateway:	10.1.1.1
- Primary DNS:	
- Secondary DNS:	
- SMTP Server Address:	
- SMTP Port:	25
- SSL:	Disable
- STARTTLS:	Disable
- Sender Email Address:	
- Authentication Mode:	None
- Sender User Name:	
- Receiver #1 Email Address:	
- Receiver #2 Email Address:	
- ESSID:	Wireless Network
- Connection:	Infrastructure
- Channel:	6
- Authentication:	WPA2-PSK
- Encryption :	AES

< Prev   Apply   Cancel

Click **Apply** to finish the wizard and reboot the camera.

Click **Prev** to go back to the previous step(s) and change the settings; or click **Cancel** to end the wizard and discard the changes.

4.2.2 Using My Android

The camera's My Android wizard lets you set up your Android mobile and Google services (Google Talk and Picasa) easily and quickly. The wizard will guide you through the necessary settings with detailed instructions on each step.

To start the wizard, click **My Android** in the left menu bar.

Step 1. Setting Up Google Talk Account

Google Talk Setting

Google Talk Account On My Camera:
Password:

Enter the Google Talk account for your camera.

Next> Cancel

Step 2. Setting Up Gmail Account

Gmail Setting

Google Mail Account On My Camera:
Password:

Enter the Gmail account for your camera.

<Prev Next> Cancel

Step 3. Setting Up Picasa Account

Picasa Setting

Picasa Account On My Android:
Password:

Enter the Picasa account for your camera.

<Prev Next> Cancel

Step 4. Setting up a YouTube Account

YouTube Setting

YouTube Account On My Android:

Password:

Enter the YouTube account for your camera.

< Prev   Next >   Cancel

Step 5. Confirm Settings

Confirm Settings

- Google Talk Account On My Camera: john@gmail.com
- Google Mail Account On My Camera: john@gmail.com
- Picasa Account On My Android: john@gmail.com

< Prev   Apply   Cancel

Click **Apply** to finish the wizard and reboot the camera.
Click **Prev** to go back to the previous step(s) and change the settings; or click **Cancel** to end the wizard and discard the changes.

NOTE Once you have set your Gmail account in step 2, the Email setting in Event Server Setting will be completed automatically. For more information, refer to the instruction of the Web Configuration, Event Server Setting >> Email.

4.3 Basic Setup

The Basic menu contains three sub-menus that provide the system settings for the camera, such as the Camera Name, Location, Date & Time, and User management.

4.3.1 Basic >> System

- **Basic:** This item allows you to assign the camera name and location information.
  - **Camera Name:** Enter a descriptive name for the camera, which is helpful to identify the camera easily while multiple cameras are connected within the network.
  - **Location:** Enter a descriptive name for the location where is monitored by the camera.
- **Indication LED Control:** This item allows you to set the LED illumination as desired. The available options include: **Normal** and **OFF**.
- **IR LED Control:** This item allows you to control the IR LED. The available options include: **Auto** and **OFF**.

4.3.2 Basic >> Date & Time

Basic - Date & Time

Date and Time

- TimeZone: (GMT-08:00) Pacific Time(US & Canada); Tijuana ▾

  ☑ Automatically adjust clock for daylight saving time changes

- ● Synchronize with PC
- ○ Synchronize with NTP Server
- NTP Server Address:
- Update Interval: 6 ▾ hours
- ○ Manual
- Date: 2012/08/07 (YYYY/MM/DD)
- Time: 14:05:46 (hh:mm:ss)

Apply   Cancel

- ● **Date and Time:** Enter the correct date and time for the system.
  - **TimeZone:** Select the proper time zone for the region from the pull-down menu.
  - **Synchronize with PC:** Select this option and the date & time settings of the camera will be synchronized with the connected computer.
  - **Synchronize with NTP Server:** Select this option and the time will be synchronized with the NTP Server. You need to enter the IP address of the server and select the update interval in the following two boxes.
  - **Manual:** Select this option to set the date and time manually.

4.3.3 Basic >> User

Basic User

Administrator		
- Password:		Modify
- Confirm Password:		

General User		
- User Name:		Add/Modify
- Password:		
- UserList:	▾	Delete

Guest		
- User Name:		Add/Modify
- Password:		
- UserList:	▾	Delete

● **Administrator:** To prevent unauthorized access to the camera's Web Configuration, you are strongly recommend to change the default administrator password. Type the administrator password twice to set and confirm the password.

● **General User**

  - **User Name/Password:** Enter the user's name you want to add to use the camera. Then, enter the password for the new user.

    After entering the User Name and Password, click **Add/Modify** to add the new user to the camera. To modify the user's information, select the one you want to modify from **UserList** and click **Add/Modify**.

  - **UserList:** Display the existing users of the camera. To delete a user, select the one you want to delete and click **Delete**.

● **Guest**

  - **User Name/Password:** Enter the user's name you want to add to use the camera. Then, enter the password for the new guest.

After entering the User Name and Password, click **Add/Modify** to add the new user to the camera. To modify the user's information, select the one you want to modify from **UserList** and click **Add/Modify**.

- **UserList:** Display the existing guests of the camera. To delete a user, select the one you want to delete and click **Delete**.

NOTE The "General User" can access the camera and control the Function buttons of the camera's Web Configuration; the "Guest' can only view the live view image from the Main screen of the Web Configuration while accessing the camera. Only the "Administrator" is allowed to configure the camera through the Web Configuration.

4.4 Network Settings

The Network menu contains the networking related settings for the camera, such as the IP Setting, DDNS Setting, IP Filter, and Wireless

Network - Network

IP Setting	
⊙ DHCP	
⦿ Static IP	
- IP:	10 . 1 . 1 . 47
- Subnet Mask:	255 . 255 . 255 . 0
- Default Gateway:	10 . 1 . 1 . 1
- Primary DNS:	. . .
- Secondary DNS:	. . .
⊙ PPPoE	
- User Name:	
- Password:	

DDNS Setting	
☐ Enable	
- Provider:	dyndns.com ▾
- Host Name:	
- User Name:	
- Password:	

UPnP	
☑ Enable	

Ports Number	
- HTTP Port:	80 (default: 80)

Apply Cancel

4.4.1 Network >> Network

● **IP Setting:** This item allows you to select the IP address mode and set up the related configuration. The default setting is **DHCP** mode enabled.

- **DHCP:** Select this option when your network uses the DHCP server. When the camera starts up, it will be assigned an IP address from the DHCP server automatically.
- **Static IP:** Select this option to assign the IP address for the camera directly. You can use IPFinder to obtain the related setting values.

IP	Enter the IP address of the camera. The default setting is 192.168.0.30.
Subnet Mask	Enter the Subnet Mask of the camera. The default setting is 255.255.255.0.
Default Gateway	Enter the Default Gateway of the camera. The default setting is 192.168.0.1.
Primary/ Secondary DNS	DNS (Domain Name System) translates domain names into IP addresses. Enter the Primary DNS and Secondary DNS that are provided by ISP.

- **PPPoE:** Select this option when you use a direct connection via the ADSL modem. You should have a PPPoE account from your Internet service provider. Enter the **User Name** and **Password**. The camera will get an IP address from the ISP as starting up.

NOTE Once the camera get an IP address from the ISP as starting up, it automatically sends a notification email to you. Therefore, when you select PPPoE as your connecting type, you have to set up the email or DDNS configuration in advance.

● **DDNS Setting:** With the Dynamic DNS feature, you can assign a fixed host and domain name to a dynamic Internet IP address. To set up the DDNS:

  1. Select the **Enable** option to enable this feature.
  2. Select the **Provider** from the pull-down list.
  3. Enter the required information in the **Host Name**, **User Name**, and **Password** boxes.

- **UPnP:** The camera supports UPnP (Universal Plug and Play), which is a set of computer network protocols that enable the device-to-device interoperability. In addition, it supports port auto mapping function so that you can access the camera if it is behind an NAT router or firewall. Select the **Enable** option to enable this feature.

- **Ports Number**
  - **HTTP Port:** The default HTTP port is **80**. Note: if you wish to view this over the internet, please open this port on your wireless router's port mapping setting. Refer to your router's manual. Once done, you can view the camera using the internet WAN IP address (refer to your router's manual).

4.4.2 Network >> Network >> Advanced

- **Bonjour:** The devices with Bonjour will automatically broadcast their own services and listen for services being offered for the use of others. If your browser with Bonjour, you can find the camera on your local network without knowing its IP address.

  The Apple Safari is already with Bonjour. You can download the complete Bonjour for Internet Explorer browser from Apple's web site by visiting http://www.apple.com/bonjour/.

- **RTSP**
  - **RTSP Streaming:** Selection the **Authentication** as **Disable**, **Basic**, or **Digest** to configure the transmission of streaming data within the network.

- **RTSP Port:** The default **RTSP Port** (Real Time Streaming Protocol) is **554**.

4.4.3 Network >> IP Filter

The IP Filter setting allows the administrator of the camera to limit the users within a certain range of IP addresses to access the camera. To disable this feature, select the **Disable** option; otherwise, select the **Accept** option to assign the range of IP addresses that are allowed to access the camera, or select the **Deny** option to assign the range of IP addresses that are blocked to access the camera.

- **Disable:** Select this option to disable the IP Filter function of the camera.
- **Accept**
  - **IPv4:** Assign a range of IP addresses that are allowed to access the camera by entering the **Start IP address** and **End IP address** options. When you are finished, click **Add** to save the range setting. You can repeat the action to assign multiple ranges for the camera.
  - **IPv6:** Enter the **IP Address** that is allowed to access the camera.
- **Deny**
  - **IPv4:** Assign a range of IP addresses that are blocked to access the camera by entering the **Start IP address** and **End IP address** options. When you are finished, click **Add** to save the range setting. You can repeat the action to assign multiple ranges for the camera.
  - **IPv6:** Enter the **IP Address** that is not allowed to access the camera.

For example, when you enter *192.168.0.50/192.168.0.80* in **Start/End IP Address** of **Accept > IPv4**, the user whose IP address located within *192.168.0.50 ~ 192.168.0.80* will be allowed to access the camera. On the other hand, if you enter the IP range in **Start/End IP Address** of **Deny > IPv4**, the user whose IP address located within the range will not be allowed to access the camera.

4.4.4 Network >> Wireless Setting (for wireless model)

The camera supports WLAN while you use the wireless network. Select the **Enable** option to enable this feature.

Network Wireless Setting

- **Wireless**
  - **Network ID (SSID):** Keep the default setting of this option to connect the camera to any access point under the infrastructure network mode. To connect the camera to a specified access point, set a SSID for the camera to correspond with the access point's ESS-ID. To connect the camera to an Ad-Hoc wireless workgroup, set the same wireless channel and SSID to match with the computer's configuration.

Click **Site Survey** to display the available wireless networks, so that you can easily connect to one of the listed wireless networks.

List of searching results

- **Wireless Mode:** Select the type of wireless communication for the camera: **Infrastructure** or **Ad-Hoc**.

- **Channel:** Select the appropriate channel from the list.

- **Authentication:** Select the authentication method to secure the camera from being used by unauthorized user: **Open**, **Shared-key**, **WPA-PSK**, and **WPA2-PSK**. The following table explains the four options:

Open	The default setting of Authentication mode, which communicates the key across the network.
Shared-key	Allow communication only with other devices with identical WEP settings.
WPA-PSK/ WPA2-PSK	WPA-PSK/WPA2-PSK is specially designed for the users who do not have access to network authentication servers. The user has to manually enter the starting password in their access point or gateway, as well as in each PC on the wireless network.

If you select **Open** or **Shared-key** as the Authentication mode, you need to complete the following settings:

- **Encryption:** Select the **WEP** option to enable the data encryption feature to secure the camera within the wireless network.
- **Format:** Once you enable the Encryption feature, you need to determine the encryption format by selecting **ASCII** or **HEX**. ASCII format causes each character you type to be interpreted as an eight-bit value. Hex format causes each pair of characters you type to be interpreted as an eight-bit value in hexadecimal (base 16) notation.
- **Key Length:** Select the WEP key length you use: **64 bits** or **128 bits**.
- **WEP Key 1/2/3/4:** Enter the WEP key(s) in the following boxes.

If you select **WPA-PSK** or **WPA2-PSK** as the Authentication mode, you need to complete the following settings:

- **Encryption:** Select **TKIP** or **AES**. TKIP (Temporal Key Integrity Protocol) changes the temporal key every 10,000 packets to insure much greater security than the standard WEP security. AES (Advanced Encryption Standard) is used to ensure the highest degree of security and authenticity for digital information.
- **Pre-Shared Key:** This is used to identify each other in the network. Enter the name in the box, and this name must match the Pre-shared key value in the remote device.

4.4.5 Network >> Wireless >> WPS Setting

WPS (Wi-Fi Protected Setup) sets a new standard of Wi-Fi security, providing a simplified secure network setup solution for the end users. Once the required settings have been completed, your wireless network can be protected by simply pressing the WPS button on the camera.

- **PROTECTED SETUP:** Press the **Reset to Unconfigured** button to reset the WPS configuration of the camera.

- **WPS**
  - **PIN Mode:** The PIN (Personal Information Number) mode builds the connection by entering the PIN Code directly. Once you enter the **PIN Code** of the camera on the router (or access point) that supports WPS, you can directly build a WPS connection between the camera and the device by simply pressing its WPS button.

  - **PBC Mode:** The PBC (Push Button Configuration) mode builds the connection by scanning the devices in the wireless network. Once you press the camera's WPS button, it starts to scan the WPS devices in the wireless network, and then you can build the WPS connection by clicking the **Connect** button.

- **Device Status:** Display the WPS configuration of the camera.

TIP   The Power LED indicates the WPS connection status by:
  - blinking 3 times when the connection is built successfully.
  - repeating 3 times of short-short-long blink when the connection is failed.

4.5 Pan & Tilt Settings

The Pan/Tilt menu allows you to configure the pan/tilt functions of the camera.

Pan & Tilt · Pan & Tilt Setting

Pan & Tilt	
· Pan/Tilt Calibration	[Calibration]
· Pan Steps:	5 (1~20) degrees
· Tilt Steps:	5 (1~20) degrees
· Auto Patrol Stay Time:	1 (1~999) sec(s)
· Startup Preset:	None ▾

[Apply] [Cancel]

- ● **Pan/Tilt Calibration:** Click **Calibration** to calibrate the position of the camera lens.

- ● **Pan Steps:** Set the changing range (1~20 degrees) when you click the Left/Right button.

- ● **Tilt Steps:** Set the changing range (1~20 degrees) when you click the Up/Down button.

- ● **Auto Patrol Stay Time:** Set the stay time (1~999 seconds) of each preset positions when the camera is patrolling.

- ● **Startup Preset:** Set the position (1~8, or None) to start patrolling.

4.6 Setting up Video & Audio

The Video & Audio menu contains four sub-menus that provide the video and audio settings for the camera.

4.6.1 Video & Audio >> Camera

- **Image Setting**
    - **Brightness:** Adjust the brightness level from 0 ~ 100.
    - **Saturation:** Adjust the colors level from 0 ~ 100.
    - **Sharpness:** Adjust the sharpness level from 0 ~ 100.
    - **TIP** Click **Default** then **Apply** to restore the default settings of the three options above.
    - **Mirror:** Select **Vertical** to mirror the image vertically, or select **Horizontal** to mirror the image horizontally.

- **Light Frequency:** Select the proper frequency according to the camera's location to reduce the flicker: **50Hz**, **60Hz** or **Outdoor**.

TIP When the camera is installed indoors, the **Light Frequency** option can be set normally (**50Hz** or **60Hz**). However, the image of live video might be over exposure if the camera is focusing on the object outdoors. When this happens, you can set the option as **Outdoor** (even when the camera is installed indoors) to fix over exposure issue.

4.6.2 Video & Audio >> Video

- **H.264**
  - **Video Resolution:** Select the desired video resolution from the four formats: **SXGA**, **VGA**, **QVGA** and **QQVGA**. The higher setting (VGA) obtains better video quality while it uses more resource within your network.
  - **Video Quality:** Select the desired image quality from five levels: **Lowest**, **Low**, **Medium**, **High**, and **Highest**.
  - **Frame Rate:** Select a proper setting depending on your network status.

- **MPEG4**
  - **Video Resolution:** Select the desired video resolution from the three formats: **VGA**, **QVGA** and **QQVGA**. The higher setting (VGA) obtains better video quality while it uses more resource within your network.
  - **Video Quality:** Select the desired image quality from five levels: **Lowest**, **Low**, **Medium**, **High**, and **Highest**.
  - **Frame Rate:** Select a proper setting depending on your network status.

- **MJPEG**
  - **Video Resolution:** Select the desired video resolution from the four formats: **SXGA**, **VGA**, **QVGA** and **QQVGA**.

The higher setting (VGA) obtains better video quality while it uses more resource within your network.

- **Video Quality:** Select the desired image quality from five levels: **Lowest**, **Low**, **Medium**, **High**, and **Highest**.
- **Frame Rate:** Select a proper setting depending on your network status.

NOTE The camera supports H.264, MPEG4 and MJPEG compression. Please note that that MJPEG mode captures the images in JPEG format, which requires higher bandwidth to view smooth video. You can control the bandwidth of each connection well through the setting options above. For the bandwidth information, refer to the *Appendix, Bandwidth Reference Guid*e.

● **3GPP:** The camera supports 3GPP specification. Select the **Disable** option to disable this feature. Otherwise, select **3GPP Without Audio** or **3GPP With Audio** to transfer the video clips without or with audio.

If you use a mobile phone that supports 3GPP, you can also view the real-time streaming image captured by the camera on your phone (with the default player on the phone) by entering the RTSP link: rtsp://(IP address of the camera)/3gp.

NOTE Your mobile phone and the service provider must support 3GPP function. Please contact your service provider when you are failed to use this service.

4.6.3 Video & Audio >> Audio

● **Camera Microphone In:** Select the **Enable** option to enable the camera's audio function, so that you can receive the on-site sound and voice from the camera.

● **Camera Speaker Out:** Select the **Enable** option to enable the camera's external speaker function, so that the connected speaker can play the sound and voice through the camera.

- **Volume:** Set the speaker's volume.

4.6.4 Video & Audio >> Overlay / Mask

This sub-menu is used to set the image overlay and mask feature of the camera.

- **Image Overlay:** This item allows you to set the image overlay.

  In the **Image File** option, click **Browse** to select the image file from your computer, and then click **Upload**. You can click **Preview** to check the image size and adjust the image position before clicking **Upload**. The preview image area is displayed with red dotted line. If you want to remove the preview image before uploading, click **Delete**.

  Since you click **Upload**, the preview image area is displayed with white dotted line. Click **Enable** and set the transparency setting by whether selecting the **Transparent** option or not.

  When done, click **Apply**. You can see the image overlay on the live view image when you click **Live View**.

  NOTE The width and height of the input overlay graphic should be multiple of 4 at a maximum size of 43690 pixels, and in JPG or BMP (24-bit RGB) format.

- **Privacy Mask:** This item allows you to configure up to two mask areas.

  Select the area 1 or 2 from the **Window** pull-down list, and then click **Enable**. You can change the size and position of the area by holding and dragging the mouse.

  You can also change the color of the mask area by clicking the **Color** box and then selecting the color you want.

  When done, click **Apply**. You can see the mask area(s) on the live view image when you click **Live View**.

4.6.5 Video & Audio >> Overlay / Mask >> Text Overlay

This page is used to set the text overlay feature of the camera, including the following three options: date & time, heading text, and background transparency setting.

- **Include Date & Time:** Select this option to display the date & time information on the live view image.

- **Include Text:** Select this option and enter your heading text in the box to display the text information on the live view image.

- **Enable Opaque:** Select this option to display the overlay text with a background color.

For example, when you select the **Include Date & Time** and **Include Text** options and click **Apply**, you can see the related information on the live view image when you click **Live View**.

4.7 Event Server Configuration

The Event Server menu contains six sub-menus that allow you to upload images to FTP, send emails that include still images, store the images to a NAS system, send instant message, and upload the image/video to your Picase account.

When you complete the required settings for FTP, Email, or Network Storage, click **Test** to test the related configuration is correct or not. Once the camera connects to the server successfully, click **Apply**.

4.7.1 Event Server Setting >> FTP

- **FTP**
  - **Host Address:** Enter the IP address of the target FTP server.
  - **Port Number:** Enter the port number used for the FTP server.
  - **User Name:** Enter the user name to login into the FTP server.
  - **Password:** Enter the password to login into the FTP server.
  - **Directory Path:** Enter the destination folder for uploading the images. For example, /Test/.
  - **Passive Mode:** Select the **Enable** option to enable passive mode.
  - **FTP Upload with:** Select upload to FTP with one snapshot image or a series image in pre-event/post-event time when event triggered.

  NOTE Due to the network environment, the camera may not upload number of images that you set.

4.7.2 Event Server Setting >> Email

- **Email**
  - **SMTP Server Address:** Enter the mail server address. For example, mymail.com.
  - **Sender Email Address:** Enter the email address of the user who will send the email. For example, John@mymail.com.
  - **SMTP Port:** Assign the SMTP port in the text box. The default SMTP port is **25**. If the mail server requires an encrypted connection, you should check the SSL option.

- **Authentication Mode:** Select **None** or **SMTP** according to the mail server configuration.
- **Sender User Name:** Enter the user name to login the mail server.
- **Sender Password:** Enter the password to login the mail server.
- **Receiver #1 Email Address:** Enter the first email address of the user who will receive the email.
- **Receiver #2 Email Address:** Enter the second email address of the user who will receive the email.
- **Send Email With:** Select the attachment type that is to be added to the email.

NOTE Due to the network environment, the camera may not upload number of images that you set.

4.7.3 Event Server Setting >> Network Storage

● **Network Storage**
   - **Samba Server Address:** Enter the IP address of the Network Storage server.
   - **Share:** Assign the folder on the Network Storage server to share the files to users.
   - **Path:** Assign the path for uploading the files on the Network Storage server. For example, /Test/.
   - **User Name:** Enter the user name to login into the Network Storage server.
   - **Password:** Enter the password to login into the Network Storage server.
   - **Split By:** When the file is too large to upload smoothly, use this option to split it by selecting **File Size** or **Recording Time**.

- **When Storage Full:** Select **Stop Recording** or **Recycle – Delete Oldest Folder** when the storage space on the Network Storage server is full.
- **Encode Format:** Select **MPEG4** or **H.264** as the encode format while recording.
- **File Format:** Select **MP4** or **AVI** as the file format while recording.

NOTE The recorded video files in Network Storage are enclosed by MP4/AVI format without audio.

4.7.4 Event Server Setting >> Instant Message

The camera supports the Jabber IM service, so that you can send an instant message once you have a Jabber account. For more information of Jabber, please visit the Jabber Website at: http://jabber.org/Main_Page.

- ● **Instant Message**
    - **Jabber ID:** Enter your user ID to login into the Jabber IM service.
    - **Jabber Password:** Enter the password to login into the Jabber IM service.
    - **Manually Specify Server Host/Port:** Select the Enable option to manually configure the Jabber server settings.
    - **Jabber Server Address:** Enter the Jabber server address manually.
    - **Jabber Port:** Assign the Jabber port manually in the text box.
    - **Encrypt Connection:** Select the **Enable** option to secure the connection.
    - **Encrypt Authentication:** Select the **Enable** option to secure the connection.
    - **Receiver:** Enter the receiver's information.
    - **Message:** Enter the message that is to be sent.

4.7.5 Event Server Setting >> Picasa Setting

The camera supports the Picasa upload service, so that you can send the camera's image to your Picasa account once you have a Picasa account.

- **Picasa Setting**
  - **User Name:** Enter your user name to login into the Picasa account.
  - **Password:** Enter the password to login into the Picasa account.
  - **Privacy:** Set the account as **Public** or **Private**.
  - **When Storage Full:** Select **Stop** or **Recycle – Delete Oldest Folder** when the storage space on the Picasa account is full.

4.8 Motion Detect

The Motion Detect menu contains the command and option that allow you to enable and set up the motion detection feature of the camera. The camera provides three detecting areas.

To enable the detecting area, select **Window 1/2/3** from the pull-down list, and then select **Enable**. When the detecting area is enabled, you can use the mouse to move the detecting area and change the area coverage.

Motion Detection- Detection Configuration
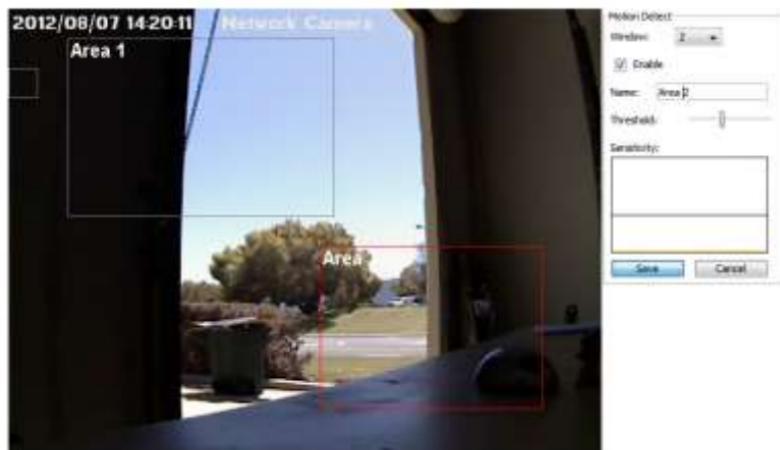

- ● **Name:** Assign a name to the detecting area.
- ● **Threshold:** Move the slide bar to adjust the level for detecting motion to record video.

NOTE Sliding the Threshold bar to the right will decrease the sensitivity of motion detection; sliding the Threshold bar to the left will increase the sensitivity of motion detection.

4.9 Event Configuration

The Event Config menu contains five sub-menus that provide the commands to configure event profiles.

4.9.1 Event Configuration >> General Setting

- **General**
  - **Snapshot/Recording Subfolder:** You can assign a descriptive name for the subfolder to save the captured image/video files. Otherwise, leave this option blank to use the default setting.
  - **Storage Recording Time Per Event:** Limit the recording time while you are using the Network Storage solution.
  - **GPIO Trigger Out Retention Time Per Event:** Limit the retention time of the GPIO Trigger Out function.

4.9.2 Event Configuration >> Arrange Schedule Profile

● **Schedule Profile:** This sub-menu displays the scheduled profile(s). To customize the profile, click **Add** and then enter a descriptive name for the profile in the prompt dialog window. After entering the profile name, click **OK** and the profile is added to the Schedule Profiles list. To delete the profile, select the profile in the list and click **Delete**.

Event Configuration - Arrange Schedule Profile

Schedule Profile

Hawking

Add   Delete

Profile Name:	Hawking
Weekdays:	● Sun ○ Mon ○ Tue ○ Wed ○ Thu ○ Fri ○ Sat
Time List:	Add Copy this to all weekdays
	Delete Delete this from all weekdays
Start Time:	:
End Time:	:

Save   Cancel
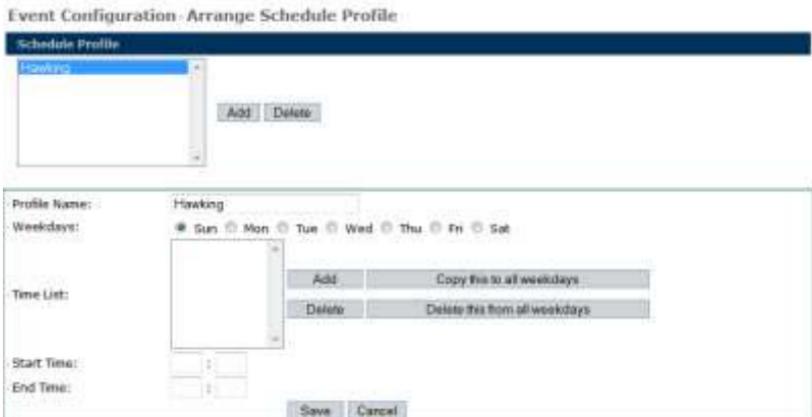

- **Profile Name:** Display the profile name that you select in the Schedule Profiles list.
- **Weekdays:** Select the weekday(s) that you want to separately assign in the schedule profile. The weekday that has been assigned will be displayed with green color.
- **Time List:** Display the time period that you have assigned within the selected weekday. To assign the same time period to every weekday, click **Copy this to all weekdays**; click **Delete this from all weekdays** to remove the selected time period from every weekday. Click Delete to remove the selected time period.
- **Start/End Time:** Enter the start and end time and then click **Add** to assign a time period within in the selected weekday.

4.9.3 Event Configuration >> Motion Detect Trigger

● **Motion Detect Trigger:** Select the **Enable** option to enable the trigger function of the camera, so that you can send captured images within the detecting area to the FTP server, email receiver, or the Network Storage server, etc. You have to configure corresponding settings, such as FTP server and email server, to enable this feature. Please note that you have to configure the related settings before enabling these features.

- **Schedule Profile:** Select a schedule profile from the pull-down list.
- **Action:** Set the trigger function to enable the **White LED** light warning, or select the destination that the captured images will be sent to: **Trigger Out**, **Record to USB**, **Record to Network Storage**, **Send Email**, **FTP Upload**, **Instant Message**, or **Upload Image to Picasa**.

4.9.4 Event Configuration >> Schedule Trigger

You can separately configure the schedule for trigger function of the camera by **Email**, **FTP**, or **Network Storage**. Select the **Enable** option on each item, and then select a **Schedule Profile** from the pull-down list and set the **Interval** time.

NOTE If the setting value of the **Storage Recording Time Per Event** option in General Setting is longer than the **Interval** time in Network Storage Schedule, the recorded file will be a continuous video clip.

For example, if you set the **Storage Recording Time Per Event** as 10 seconds and the **Interval** as 5 seconds, recorded file becomes a non-stop video clip because the camera will record a 10-second video clip every 5 seconds.

4.9.5 Event Configuration >> GPIO Trigger

● Select the **Enable Trigger in 1** option to enable the GPIO trigger function of the camera, so that you can set Trigger Out function or send captured images within the detecting area to the FTP server, email receiver, Network Storage server, or the connected USB device. You have to configure corresponding settings, such as FTP server and email server, to enable this feature.

   - **Schedule Profile:** Select a schedule profile from the pull-down list.

   - **Action:** Set the trigger function to enable the **White LED** light warning, or select the destination that the captured images will be sent to: **Trigger Out**, **Record to USB**, **Record to Network Storage**, **Send Email**, **FTP Upload**, **Instant Message**, or **Upload Image to Picasa**.

4.10 Tools

The Tools menu provides the commands that allow you to restart or reset the camera. You can also backup and restore your configuration, and upgrade the firmware for the camera.

- **Factory Reset:** Click **Reset** to restore all factory default settings for the camera.

- **System Reboot:** Click **Reboot** to restart the camera just like turning the device off and on. The camera configuration will be retained after rebooting.

- **Configuration:** You can save your camera configuration as a backup file on your computer. Whenever you want to resume the original settings, you can restore them by retrieving the backup file.
  - **Backup:** Click **Get the backup file** to save the current configuration of the camera.
  - **Restore:** Click **Browse** to locate the backup file and then click **Restore**.

- **Update Firmware:** You can upgrade the firmware for your camera once you obtained a latest version of firmware.

- **Current Firmware Version:** This item displays the current firmware version.
- **Select the firmware:** Click **Browse** to locate the backup file and then click **Update**.

NOTE Make sure to keep the camera connected to the power source during the process of upgrading firmware. Otherwise, the camera might be damaged because of failure of upgrading firmware.

When this happens, the system will enable the Rescue mode (as shown below) after the camera reboots, so that you can upgrade the firmware again.

4.11 USB

The USB menu provides the information and controls of the connected USB device.

- ● **USB Dismount:** To safely remove the connected USB device, you can press the Unmount button for four seconds on the camera or click **Dismount** from this item.

- ● **USB Information:** Display the **Total space** and **Free space** of the USB device.

- ● **USB Setting**
  - - **Split By:** When the file is too large to transfer smoothly, use this option to split it by selecting **File Size** or **Recording Time**.
  - - **When Storage Full:** Select **Stop Recording** or **Recycle – Delete Oldest Folder** when the storage space on the USB device is full.
  - - **Encode Format:** Set the encode format of the captured image as **MJPEG** or **H.264**.

- **File Format:** Set the file format of the recorded video as **MP4** or **AVI**.

4.12 Information

The Information menu displays the current configuration and events log of the camera.

- **Device Info:** Display the Basic, Video & Audio, and Network settings of the camera.

- **System Log:** The Logs table displays the events log recorded by the system.

Appendix

A.1 Specification

■ **Image Sensor**
Sensor   1/4" Color Megapixel CMOS Sensor
Resolution   1280 x 1024
Min. Illumination 2 Lux

■ **System Hardware**
Processor   ARM9 base
RAM   64MB SDRAM
ROM   8MB NOR Flash
Power   DC 12V
Power Consumption 10W max.

■ **Lens Assembly**
Lens Type   Board Lens
Lens Specification F2.8, 4.0mm
View Angle   60 degree

■ **Video**
Compression   H.264/MPEG4/MJPEG
Video resolution H.264 & MJPEG: SXGA (1280 x 1024)
@ 15fps / VGA (640 x 480) @ 30fps /
QVGA (320 x 240) @ 30fps / QQVGA
(160 x 120) @ 30fps; MPEG4: VGA
(640 x 480) @ 30fps / QVGA (320 x 240)
@ 30fps / QQVGA (160 x 120) @ 30fps

- **Communication**

  LAN   10/100Mbps Fast Ethernet with Auto-MDIX

  WLAN   (for wireless model) IEEE 802.11b/g/n

  Protocol support TCP/IP,IPV6, UDP, ICMP,DHCP client, NTP, DNS, DDNS, SMTPs, FTP, HTTP, Samba, UPnP, RTP, RTCP, RTSP

- **Audio**

  Input   Built-in microphone

  Output   Headphone output jack (Mono)

  Codec   PCM/AMR (AMR is for 3GPP only)

- **User Interface**

  LAN   One RJ-45 port

  Antenna   (for wireless model) One external antenna

  USB Port   USB 2.0 port, with one unmount button; Power distribution: 500mA Max.

  GPIO   1 in/1 out connectors

                       Input: active high: 9~40V DC; dropout: 0V DC

                       Output: close circuit current 70mA AC or 100mA DC maximum, 30 Ohm; open circuit voltage 240V AC or 350V DC maximum

  USB Dismount   One USB Dismount button

  Reset   One Reset button

  WPS   (for wireless model) One WPS button

  Volume   Two Volume (up/down) buttons

  LEDs   Power LED (amber); Link LED (green)

- **Pan/Tilt**
  - **Pan**   165 degree (left) to 165 degree (right)
  - **Tilt**   90 degree (up) to 15 degree (down)

- **Software**
  - **OS Support**   Windows XP/Vista, and Windows 7
  - **Browser**   Internet Explorer 6.0 or above; Apple Safari 2 or above; Mozilla Firefox 2.00 or above
  - **Software**   UltraView Pro for playback/recording/ configuration features

- **Operating Environment**
  - **Temperature**   Operation: 0°C ~ 45°C; Storage: -15°C ~ 60°C
  - **Humidity**   Operation: 20% ~ 85% non-condensing; Storage: 0% ~ 90% non-condensing

- **EMI**   LVD, EuP Power report (ERP), FCC/CE class B

A.2 Terminal Application

Typically used in association with programming scripts for developing applications for motion detection, event triggering, alarm notification via e-mail, and a variety of external control functions. The GPIO connectors are located on the rear panel of the camera, which provide the interface of connecting the sensor device (IN) and controlled device (OUT).

■ Connector Pin Assignment

PIN	SPECIFICATION
IN	Active High voltage 9~40V DC; Dropout-out voltage 0V DC
OUT	Close circuit current 70mA AC or 100mA DC maximum, Output resistance 30 Ohm; Open circuit voltage 240V AC or 350V DC maximum

■ Interface Schematic
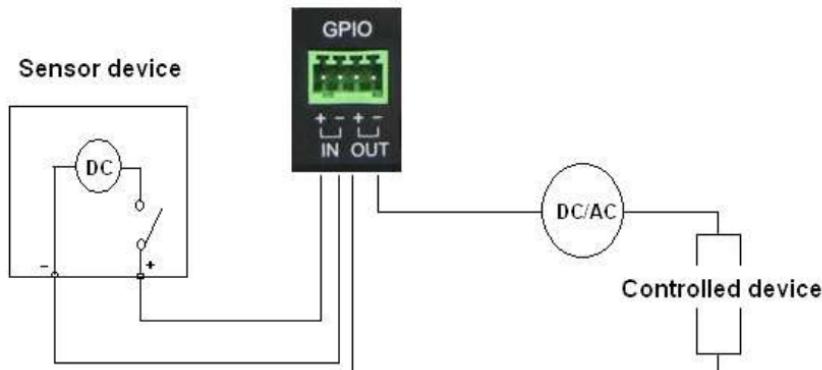

A.3 Glossary of Terms

NUMBERS

10BASE-T   10BASE-T is Ethernet over UTP Category III, IV, or V unshielded twisted-pair media.

100BASE-TX   The two-pair twisted-media implementation of 100BASE-T is called 100BASE-TX.

A

ADPCM   Adaptive Differential Pulse Code Modulation, a new technology improved from PCM, which encodes analog sounds to digital form.

AMR   AMR (Adaptive Multi-Rate) is an audio data compression scheme optimized for speech coding, which is adopted as the standard speech codec by 3GPP.

Applet   Applets are small Java programs that can be embedded in an HTML page. The rule at the moment is that an applet can only make an Internet connection to the computer form that the applet was sent.

ASCII   American Standard Code For Information Interchange, it is the standard method for encoding characters as 8-bit sequences of binary numbers, allowing a maximum of 256 characters.

ARP   Address Resolution Protocol. ARP is a protocol that resides at the TCP/IP Internet layer that delivers data on the same network by translating an IP address to a physical address.

AVI   Audio Video Interleave, it is a Windows platform audio and video file type, a common format for small movies and videos.

B

BOOTP   Bootstrap Protocol is an Internet protocol that can automatically configure a network device in a diskless workstation to give its own IP address.

C

Communication   Communication has four components: sender, receiver, message, and medium. In networks, devices and application tasks and processes communicate messages to each other over media. They represent the sender and receivers. The data they send is the message. The cabling or transmission method they use is the medium.

Connection   In networking, two devices establish a connection to communicate with each other.

D

DHCP   Developed by Microsoft, DHCP (Dynamic Host Configuration Protocol) is a protocol for assigning dynamic IP addresses to devices on a network. With dynamic addressing, a device can have a different IP address every time it connects to the network. In some systems, the device's IP address can even change while it is still connected. It also supports a mix of static and dynamic IP addresses. This simplifies the task for network administrators because the software keeps track of IP addresses rather than requiring an administrator to manage the task. A new computer can be added to a network without the hassle of manually assigning it a unique IP address. DHCP allows the specification for the service provided by a router, gateway, or other network device that automatically assigns an IP address to any device that requests one.

DNS   Domain Name System is an Internet service that translates domain names into IP addresses. Since domain names are alphabetic, they're easier to remember. The Internet however, is really based on IP addresses every time you use a domain name the DNS will translate the name into the corresponding IP address. For example, the domain name *www.network_camera.com* might translate to *192.167.222.8*.

E

Enterprise network An enterprise network consists of collections of networks connected to each other over a geographically dispersed area. The enterprise network serves the needs of a widely distributed company and operates the company's mission-critical applications.

Ethernet The most popular LAN communication technology. There are a variety of types of Ethernet, including 10Mbps (traditional Ethernet), 100Mbps (Fast Ethernet), and 1,000Mbps (Gigabit Ethernet). Most Ethernet networks use Category 5 cabling to carry information, in the form of electrical signals, between devices. Ethernet is an implementation of CSMA/CD that operates in a bus or star topology.

F

Fast Ethernet Fast Ethernet, also called 100BASE-T, operates at 10 or 100Mbps per second over UTP, STP, or fiber-optic media.

Firewall Firewall is considered the first line of defense in protecting private information. For better security, data can be encrypted. A system designed to prevent unauthorized access to or from a private network. Firewalls are frequently used to prevent unauthorized Internet users from accessing private networks connected to the Internet, especially Intranets all messages entering or leaving the intranet pass through the firewall, which examines each message and blocks those that do not meet the specified security criteria.

G

Gateway A gateway links computers that use different data formats together.

Group Groups consist of several user machines that have similar characteristics such as being in the same department.

H

HEX
Short for hexadecimal refers to the base-16 number system, which consists of 16 unique symbols: the numbers 0 to 9 and the letters A to F. For example, the decimal number 15 is represented as F in the hexadecimal numbering system. The hexadecimal system is useful because it can represent every byte (8 bits) as two consecutive hexadecimal digits. It is easier for humans to read hexadecimal numbers than binary numbers.

I

Intranet
This is a private network, inside an organization or company that uses the same software you will find on the public Internet. The only difference is that an Intranet is used for internal usage only.

Internet
The Internet is a globally linked system of computers that are logically connected based on the Internet Protocol (IP). The Internet provides different ways to access private and public information worldwide.

Internet address
To participate in Internet communications and on Internet Protocol-based networks, a node must have an Internet address that identifies it to the other nodes. All Internet addresses are IP addresses

IP
Internet Protocol is the standard that describes the layout of the basic unit of information on the Internet (the *packet*) and also details the numerical addressing format used to route the information. Your Internet service provider controls the IP address of any device it connects to the Internet. The IP addresses in your network must conform to IP addressing rules. In smaller LANs, most people will allow the DHCP function of a router or gateway to assign the IP addresses on internal networks.

IP address
IP address is a 32-binary digit number that identifies each sender or receiver of information that is sent in packets across the Internet. For example 80.80.80.69 is an IP address. When you "call" that number, using any

	connection methods, you get connected to the computer that "owns" that IP address.
ISP	ISP (Internet Service Provider) is a company that maintains a network that is linked to the Internet by way of a dedicated communication line. An ISP offers the use of its dedicated communication lines to companies or individuals who can't afford the high monthly cost for a direct connection.

J
JAVA	Java is a programming language that is specially designed for writing programs that can be safely downloaded to your computer through the Internet without the fear of viruses. It is an object-oriented multi-thread programming best for creating applets and applications for the Internet, Intranet and other complex, distributed network.

L
LAN	Local Area Network a computer network that spans a relatively small area sharing common resources. Most LANs are confined to a single building or group of buildings.

M
MJPEG	MJPEG (Motion JPEG) composes a moving image by storing each frame of a moving picture sequence in JPEG compression, and then decompressing and displaying each frame at rapid speed to show the moving picture.
MPEG4	MPEG4 is designed to enable transmission and reception of high-quality audio and video over the Internet and next-generation mobile telephones.

N
NAT	Network Address Translator generally applied by a router that makes many different IP addresses on an

internal network appear to the Internet as a single address. For routing messages properly within your network, each device requires a unique IP address. But the addresses may not be valid outside your network. NAT solves the problem. When devices within your network request information from the Internet, the requests are forwarded to the Internet under the router's IP address. NAT distributes the responses to the proper IP addresses within your network.

Network
A network consists of a collection of two or more devices, people, or components that communicate with each other over physical or virtual media. The most common types of network are:

LAN – (local area network): Computers are in close distance to one another. They are usually in the same office space, room, or building.

WAN – (wide area network): The computers are in different geographic locations and are connected by telephone lines or radio waves.

NWay Protocol
A network protocol that can automatically negotiate the highest possible transmission speed between two devices.

P

PCM
PCM (Pulse Code Modulation) is a technique for converting analog audio signals into digital form for transmission.

PING
Packet Internet Groper, a utility used to determine whether a specific IP address is accessible. It functions by sending a packet to the specified address and waits for a reply. It is primarily used to troubleshoot Internet connections.

PPPoE
Point-to-Point Protocol over Ethernet. PPPoE is a specification for connecting the users on an Ethernet to the Internet through a common broadband medium, such as DSL or cable modem. All the users over the Ethernet share a common connection.

Protocol   Communication on the network is governed by sets of rules called protocols. Protocols provide the guidelines devices use to communicate with each other, and thus they have different functions. Some protocols are responsible for formatting and presenting and presenting data that will be transferred from file server memory to the file server's net work adapter Others are responsible for filtering information between networks and forwarding data to its destination. Still other protocols dictate how data is transferred across the medium, and how servers respond to workstation requests and vice versa. Common network protocols responsible for the presentation and formatting of data for a network operating system are the Internetwork Packet Exchange (IPX) protocol or the Internet Protocol (IP). Protocols that dictate the format of data for transferors the medium include token-passing and Carrier Sense Multiple Access with Collision Detection (CSMA/CD), implemented as token-ring, ARCNET, FDDI, or Ethernet. The Router Information Protocol (RIP),a part of the Transmission Control Protocol/Internet Protocol (TCP/IP) suite, forwards packets from one network to another using the same network protocol.

<u>R</u>
RJ-45   RJ-45 connector is used for Ethernet cable connections.
Router   A router is the network software or hardware entity charged with routing packets between networks.
RTP   RTP (Real-time Transport Protocol) is a data transfer protocol defined to deliver **live media** to the clients at the same time, which defines the transmission of video and audio files in real time for Internet applications.
RTSP   RTSP (Real-time Streaming Protocol) is the standard used to transmit **stored media** to the client(s) at the same time, which provides client controls for random access to the content stream.

S

Server   It is a simple computer that provides resources, such as
                      files or other information.

SIP   SIP (Session Initiated Protocol) is a standard protocol
                      that delivers the real-time communication for Voice over
                      IP (VoIP), which establishes sessions for features such
                      as audio and video conferencing.

SMTP   The Simple Mail Transfer Protocol is used for Internet
                      mail.

SNMP   Simple Network Management Protocol. SNMP was
                      designed to provide a common foundation for
                      managing network devices.

Station   In LANs, a station consists of a device that can
                      communicate data on the network. In FDDI, a station
                      includes both physical nodes and addressable logical
                      devices. Workstations, single-attach stations, dual-
                      attach stations, and concentrators are FDDI stations.

Subnet mask   In TCP/IP, the bits used to create the subnet are called
                      the subnet mask.

T

(TCP/IP)   Transmission Control Protocol/Internet Protocol is a
                      widely used transport protocol that connects diverse
                      computers of various transmission methods. It was
                      developed y the Department of Defense to connect
                      different computer types and led to the development of
                      the Internet.

Transceiver   A transceiver joins two network segments together.
                      Transceivers can also be used to join a segment that
                      uses one medium to a segment that uses a different
                      medium. On a 10BASE-5 network, the transceiver
                      connects the network adapter or other network device
                      to the medium. Transceivers also can be used on
                      10BASE-2 or 10BASE-T networks to attach devices
                      with AUI ports.

U

UDP	The User Datagram Protocol is a connectionless protocol that resides above IP in the TCP/IP suite
User Name	The USERNAME is the unique name assigned to each person who has access to the LAN.
Utility	It is a program that performs a specific task.
UTP	Unshielded twisted-pair. UTP is a form of cable used by all access methods. It consists of several pairs of wires enclosed in an unshielded sheath.

W

WAN	Wide-Area Network. A wide-area network consists of groups of interconnected computers that are separated by a wide distance and communicate with each other via common carrier telecommunication techniques.
WEP	WEP is widely used as the basic security protocol in Wi-Fi networks, which secures data transmissions using 64-bit or 128-bit encryption.
Windows	Windows is a graphical user interface for workstations that use DOS.
WPA	WPA (Wi-Fi Protected Access) is used to improve the security of Wi-Fi networks, replacing the current WEP standard. It uses its own encryption, Temporal Key Integrity Protocol (TKIP), to secure data during transmission.
WPA2	Wi-Fi Protected Access 2, the latest security specification that provides greater data protection and network access control for Wi-Fi networks. WPA2 uses the government-grade AES encryption algorithm and IEEE 802.1X-based authentication, which are required to secure large corporate networks.
